1. História

MIT App Inventor, também conhecido como App Inventor for Android, é **uma aplicação código aberto** originalmente criada pela **Google**, e atualmente mantida pelo **Massachusetts Institute of Technology (MIT)**.

Ele permite que os recém-chegados à programação de computador criem aplicativos de software para o **sistema operacional Android**. Ele usa uma **interface gráfica**, muito semelhante ao do zero e da interface do usuário StarLogo TNG, que permite aos usuários **arrastar e soltar** objetos visuais para criar um aplicativo que pode ser executado em dispositivos Android.

1. História

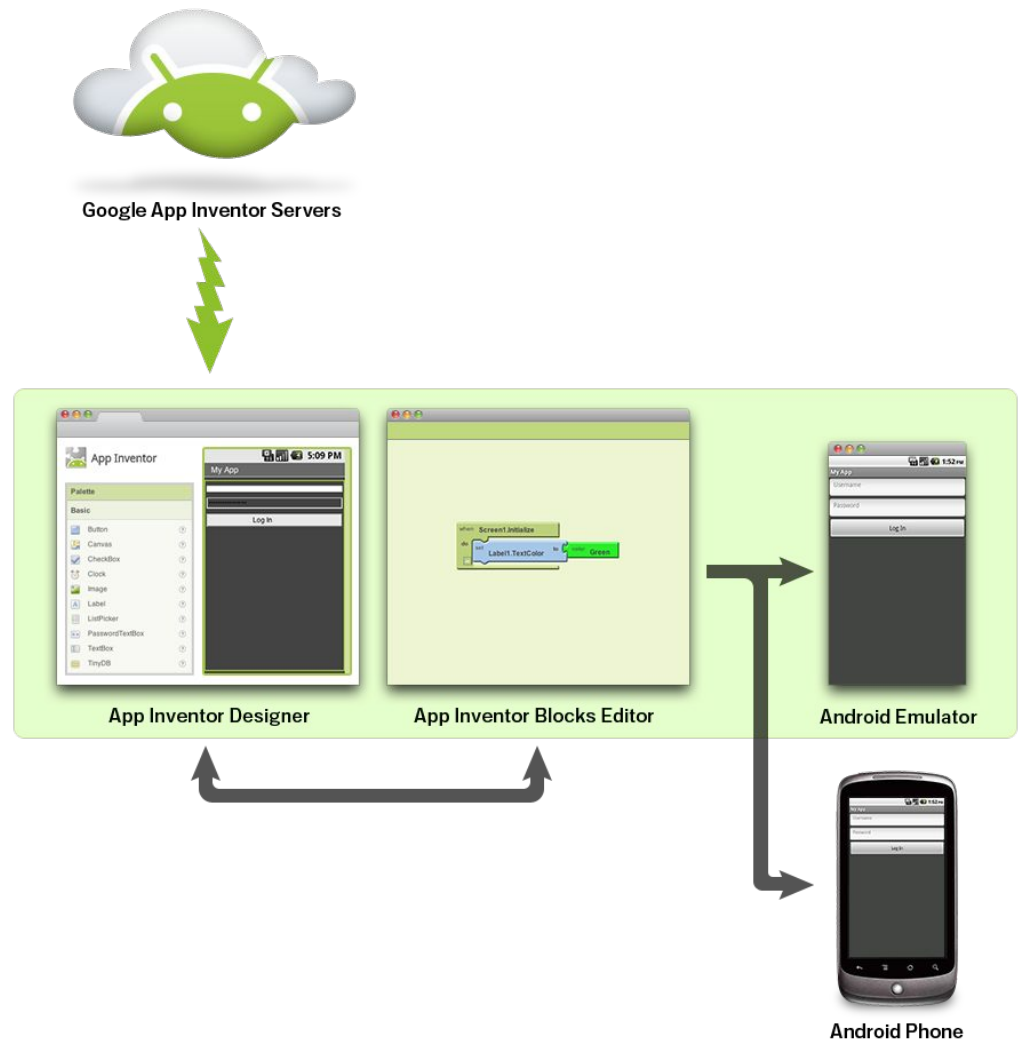

Ao criar o App Inventor, o Google se valeu de pesquisas significativas prévia em **informática educativa**, bem como o trabalho feito dentro do Google em ambientes de desenvolvimento on-line.

A plataforma App Inventor ainda é muito **instável** e **amadora**, focada em desenvolver apenas aplicativos para **pesquisas escolares**, impossibilitando o desenvolvimento de qualquer **aplicativo profissional**.

4. Exemplos práticos

- SUAP+HIFPB+IFPB
- Quanto gasta de energia no mês?

The screenshot shows a form titled 'Quanto gasta de energia no mês?'. It contains several input fields: 'Potência (W)' with the value '6', 'Uso diário (h)' with the value '3', 'Preço kWh (R\$)' with the value '0.85', and 'Conta de energia (R\$)' with the value '150'. The 'Conta de energia (R\$)' field is highlighted with an orange border. Below the input fields is a 'calcular' button. At the bottom of the form, the results are displayed: 'R\$ 0.46' and '0.31 %'.

5. Integração com ThingSpeak

```
#include <ESP8266WiFi.h>
#include <ThingSpeak.h>

// WIFI
const char* ssid = "APtelefonica"; // rede wifi
const char* password = "Projeto360AP"; // senha wifi

// Variáveis
int count, val, LDRpin = A0, LED = 16, ledStatus=0;

// Canal 1
unsigned long myChannelNumber1 = 773444; // ID do
const char * myWriteAPIKey1 = "UKXTT7UAOM24JY40"; // chave de escrita
const char * myReadAPIKey1 = "FB800MW0GYFK5CXN"; // chave de leitura

// Canal 2
unsigned long myChannelNumber2 = 774516; // ID do canal 2
const char * myWriteAPIKey2 = "PQYQ84TOF21TPHNJ"; // chave de escrita
const char * myReadAPIKey2 = "0PLPFQIR3E3GFHZ7"; // chave de leitura

WiFiClient client;

void setup(){

  pinMode(LED, OUTPUT);
  digitalWrite(LED, LOW);

  // conecta wifi
  WiFi.begin(ssid, password);
```

Código Arduino

```
ThingSpeak.begin(client);
```

```
delay(100);
```

```
Serial.begin(115200);
```

```
}
```

```
void loop(){
```

```
  if(count==10){
```

```
    val = analogRead(LDRpin); // Lê valor LDR
```

```
    Serial.println(val); //imprimi na serial
```

```
    // ID do canal, campo, valor, chave de escrita
```

```
    ThingSpeak.writeField(myChannelNumber1, 1,val, myWriteAPIKey1); //Update
```

```
    count=0;
```

```
}
```

```
// Lê estatus LED
```

```
ledStatus = int(ThingSpeak.readIntField(myChannelNumber2, 1, myReadAPIKey2));
```

```
Serial.println(ledStatus); // imprimi na serial
```

```
digitalWrite(LED, ledStatus); // Controla LED
```

```
delay(2000);
```

```
count++;
```

```
}
```
